## Centre for Lightweight Textile Construction

### About this organisation

#### Machine translation

This organisation has been machine-translated based on data provided in German.

Since its foundation 30 years ago, the Saxon Textile Research Institute (STFI) has been a strong innovation partner and reliable service provider on behalf of its customers. The non-profit institute tackles technical and social issues with an open, interdisciplinary and reliable approach. Textile materials have always characterised its work.

Lightweight textile construction in all its facets has increasingly become the focus of research at the STFI in recent years. From the development of semi-finished textile products and the creation of new, sometimes hybrid material composites to recycling and reuse, the entire value chain is being analysed. Carbon fibre-reinforced plastics for a wide range of applications from the transport and automotive sectors to mechanical engineering play a major role in the research work. However, other reinforcing fibres, such as glass, basalt, aramid and natural fibres, are also considered in different matrix systems. The spectrum ranges from classic thermoset and thermoplastic systems to elastomers and mineral matrices. In addition to researching new materials and processes, the parallel development of suitable test methods and complex evaluation criteria is a focal point of the work.

Annaberger Straße 240
